

MEDICAL SERVICE WEBSITE

INTRODUCTION

The place where I live can be described as medical city of our state. There is a huge demand for medical products like vaccines, syringes, medicines even ambulances. Consider a situation where there is an immediate need of some medicine, it is very difficult to find an appropriate medical store where I can find that medicine. I want to build a website that has list of medicines from many famous medical stores nearby. This project benefits the Doctors to suggest a proper place where can one find the medicine and if it's available or not. This may also help the patients to take decisions quickly by having a look at the price at different stores.

EXPECTED LIST OF FEATURES

The website supports the local medical dealers to publicize their organisation and gain popularity over others. It may help the dealers to know about the medicines that are not available near them and can have dealership of that medicine. The data generated from the website may help to estimate how good the medical facility in that location. With proper permissions it is also possible to sell the medicines via this portal as it's not possible for the patient to go to the location far from him.

MARKET SURVEY

There are many online websites with a goal to sell medicines like [Netmeds](#), [Medibuddy](#), [Zoylo](#) etc. These websites can be considered as the organisations that have their shops here and there in the cities and sell their medicines from via an online portal with cash on delivery option. However the website I am planning to build will keep track of all the shops with several sorting options and display several options for the user. It is the users' decision to buy from that store or from any other.
